THE MAKING OF OUR BIG POTS PLACED INTO A MOULD

Placed into a mould

The clay is hit into the mould by hand.

Our big pots are placed into the mould.

We receive the clay from our own clay department, after all it all starts with the good basics. The lumps of clay are getting rolled until they are flat enough, the result are pieces with a thickness of around 3 centimeters. These pieces are hit into the mould, it needs a lot of detailing to make sure that the inner surface is clean and the edges are properly done.

Once this is done the pot will start his drying process, and that process begins inside his mould. This is beautifully illustrated on picture number 02., the clay loses water during this drying whereby the pot shrinks.

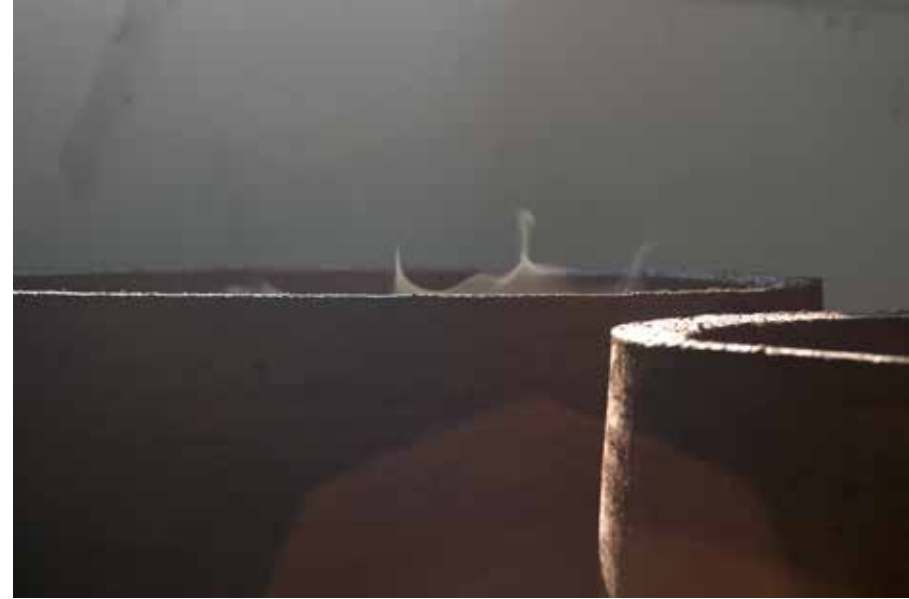

The during of this process depends on the size of the pot and the type of the clay that was used. This varies from five to fourteen days and even longer.

Once the pot is dry enough, the mould gets removed gently.

Ecology

To reduce our ecological footprint our pots are not pre-baked or glazed afterwards. We use a technique the French call “monocuisson”. Primary baking and glazing happens all at once, using considerably less energy.

Check out the production movie of the Dala vase on our Facebook page www.facebook.com/domani.belgium or on our website, and discover how it is made.

TECHNICAL INFORMATION

All our Domani items are handmade in our own European production

Frostproof

All our terra cotta and zinc collections that have a drainage hole are frost proof. Please note that some shapes need more care if you plant them and put them outside.

Rubber feet

All outdoor pots are delivered with rubber feet.

Limited

We use real silver- and gold leaves, they will tarish with time. For indoor use

Material information

Terra cotta

Our own high quality clay has a kaolin basis with special properties.

While baking the clay will coalesce so that virtually no absorption of water is possible. Our terra cotta absorbs no more than 3-4% of water. With this low percentage of water our potteries are guaranteed frost proof.

Zinc

We use titanium-zinc plates soldered together with tin. Our zinc contains 4% of silver, which makes it extremely durable. When zinc is exposed to humid air or water it will naturally oxidize. First the zinc will create a white powder to protect itself, then a light grey patina will appear. Our zinc pots are delivered with water drainage on the side.

Diameter

This is the outside diameter of the pot

Height

This is the total height of the pot, from top to bottom

Dimensions

may vary due to shrinkage

TECHNICAL INFORMATION

All our Domani items are handmade in our own European production

Hand turned

These are turned by hand. This makes every pot a unique piece.

Rotated inside a mould

In a rotating movement the clay is pushed by a knife into the mould.

Waterproof

Our Luzon and Mumbai pots are 100% waterproof and can be used as flower vases.

Raku

Raku is a baking technique originated in Japan, in the mid-sixteen century. During the extreme temperature change of cooling down, crazing or cracking occurs on many of the glazed areas of the pots. The multitude of parameters involved provides results varying at infinity, which gives each piece the quality of single objet.
